

Modelled geological feasibility vs set scenario goals, by country

Each panel: MC sample cloud (growth rate vs required resource, colour = model). Right strip (same y-axis): per failed scenario, screening-informed reconstruction C markers (shape = model; mean of ascending & descending ordering) hang below the scenario goal C — the min/ref/max gridlines, marked with a coloured cap. Connector length = geological shortfall.

Samples & dumbbell encoding

- Logistic MC samples
- ▲ Gompertz MC samples
- Goal: scenario resource C (gridline + coloured cap)
- Reconstruction C — Logistic (●)
- ▲ Reconstruction C — Gompertz (▲)
- Connector length = geological shortfall

- Scenario (goal cap & reconstruction marker colour)
- Growth 10%
 - IPCC High
 - IPCC Low
 - Maximum
 - Policy
 - Reference
 - US 1 Gt
